Key Achievement:

100% own-developed DFS-inspired navigation algorithm using a weighted backtracking system instead of a conventional backtracking stack. Our robot uses a fully custom exploration algorithm that replaces the traditional DFS stack with a tile-based visit-weighting system. Each tile maintains a visit counter, and tiles marked with 99 ("Exhausted Path") are treated as fully explored and excluded from future navigation decisions. This allows the robot to perform deterministic DFS-style exploration using only local state
